

A COMPARISON STUDY OF SUMMER-SEASON LAND SURFACE CLIMATOLOGY IN CFSV2 WITH THREE CFS RUNS USING DIFFERENT ATMOSPHERE AND OCEAN MODELS

Rongqian Yang, Michael Ek and Jesse Meng
The EMC Land/Hydro Team

EMC/NCEP/NWS
5200 Auth Road, Camp Springs, MD 20746, USA

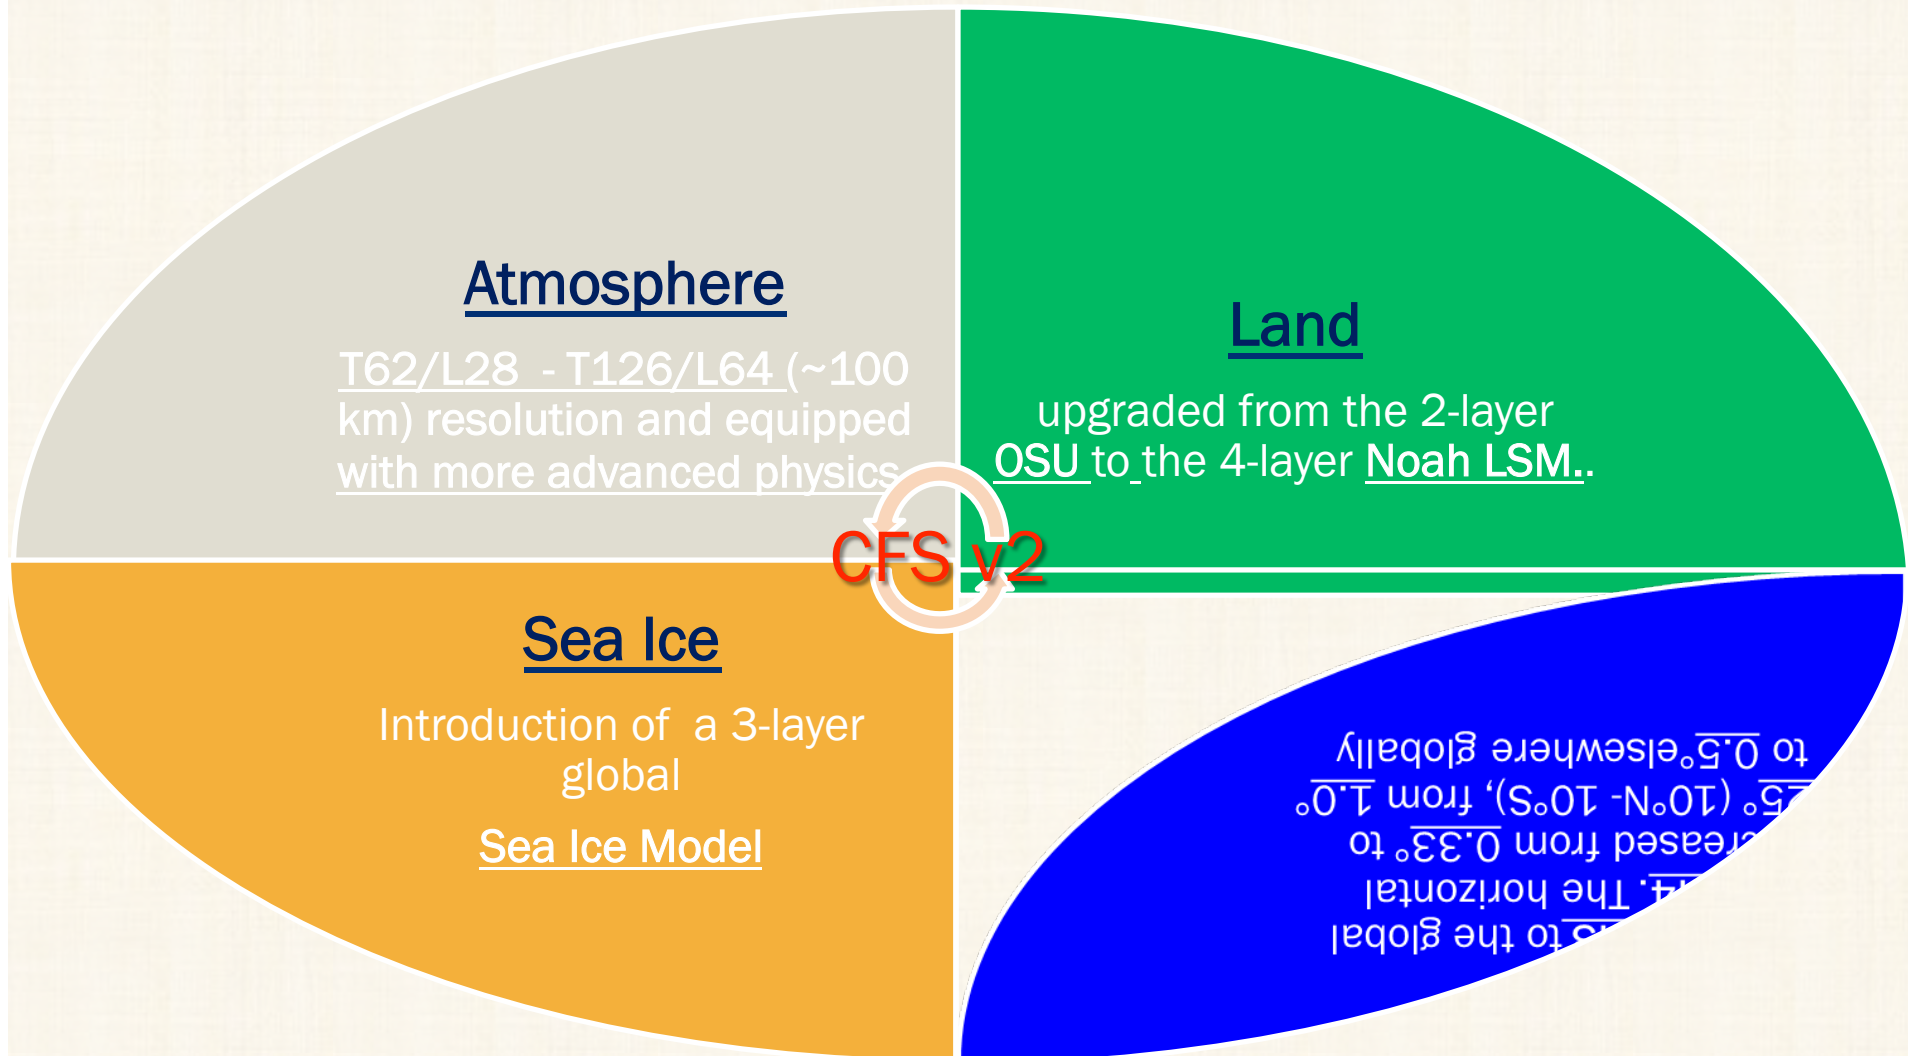

CFSv2 Evaluation Workshop
April 30 – May 1, 2012
College Park, Maryland

OBJECTIVES

- ❑ Compare the differences in predicted warm season surface characteristics between the CFS runs.
- ❑ Examine the impact of upgrades on ocean, land and atmosphere and their relative importance on predicted climatology and prediction skills.

THE NEW NCEP CFS V2

Fully Coupled Ocean-Land-Atmosphere System, implemented in March, 2011

CFS COMPARISON

1982–2004 (23 summers)

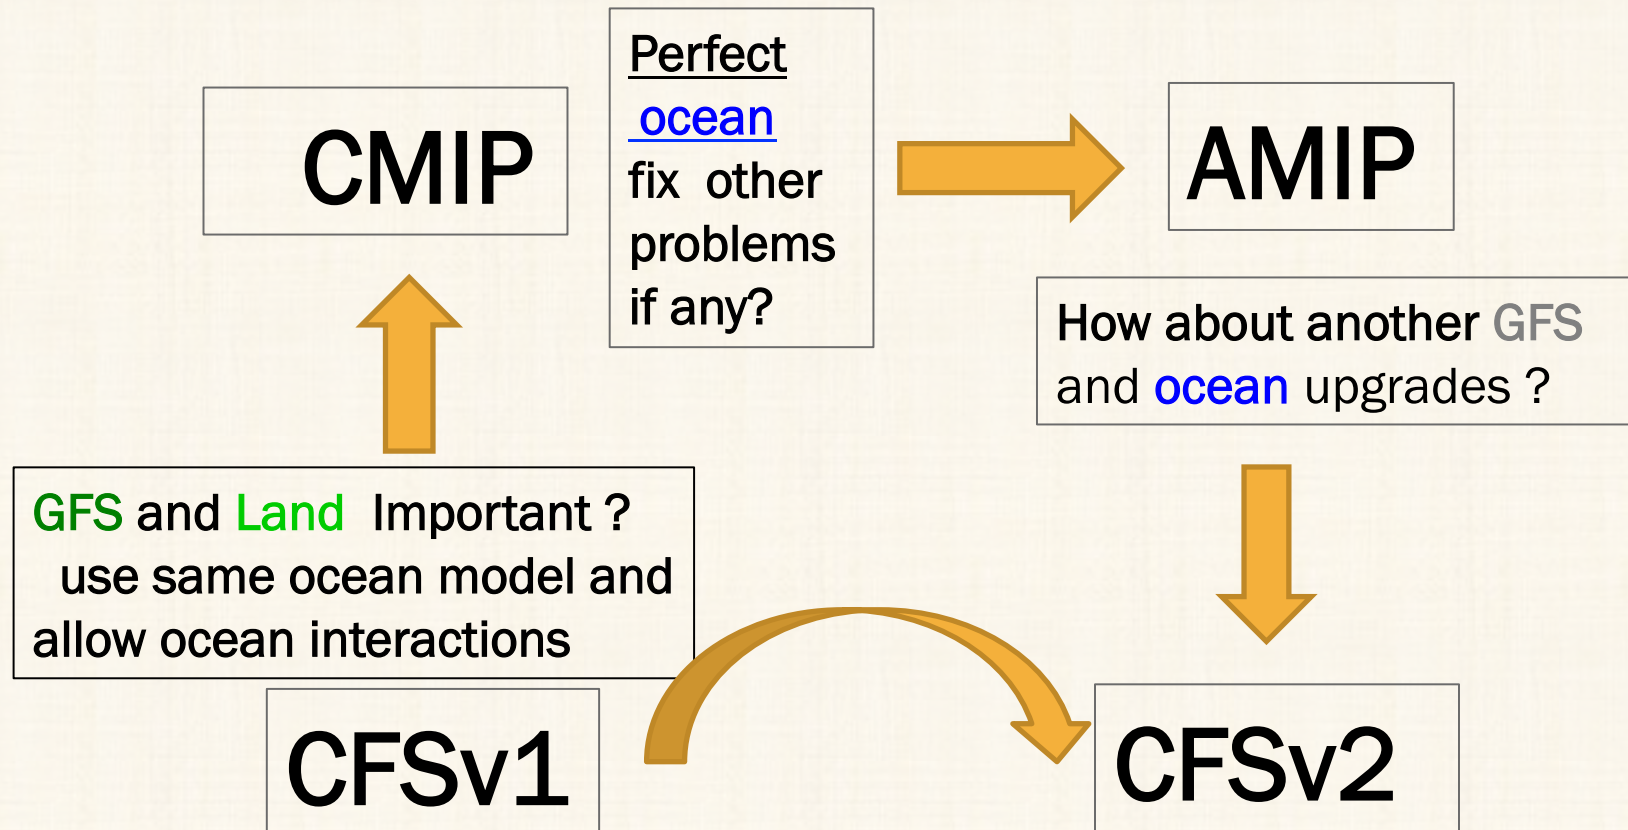

CFSv2 CMIP ICs (12) T126/L64 0421, 0426, 0501 (4 cycles)	Op3t3 CFS AMIP ICs (10) T126/L64 041900 -042300 042900-050300	Op3t3 CFS CMIP ICs (10) T126/L64 041900-042300 042900-050300	CFSv1 CMIP ICs (10) T62/L28 041900 -042300 042900-050300
---	--	---	---

The Op3t3 CFS shares the same ocean model used in the CFSv1
The CFSv2 shares the same Noah land model used in Op3t3 CFS

Self consistent initial conditions (Mid-April to Early May)
CFSv2 --- from CFSR; Op3t3 CFS - from offline GLDAS ; CFSv1 - GR2

Focus on June, July and August Average (JJA)

WHAT WE CAN LEARN?

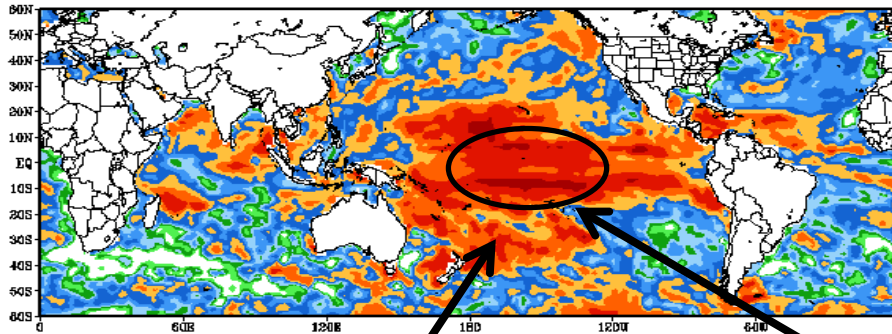

- ❖ Identify the relative importance of each component from a variety of upgrades and potential problems.
- ❖ Determine the direction for future improvement.

consistent with precip over S.H.

SUMMARY

1. Compared to CFSv1

CFSv2

Better tropical SST
Reduced high precipitation bias over the N.H.
Slightly better precipitation skill over Europe-Asia.
Better T2m and higher prediction skill Europe-Asia
Better downward and net radiation
Less latent heat and sensible heat
Higher soil moisture and closer to GLDAS

2. Compared to CMIP

CFSv2

sst performance varies depending on the Nino regions
high precipitation bias over the N.H., low bias over the S.H.
Lower precipitation skill over the S.A.
Better T2m, but no clear advantage on the skill
Less Rdown but higher Rnet over the N.H. and lower in the S.H.
More latent heat and less sensible heat and soil moisture.

3. Compared to AMIP

CFSv2

Similar to CMIP

4. AMIP compared to CMIP

AMIP

tends to perform worse, no big difference

SUMMARY (CONT'D)

- Overall, the CFSv2 has achieved a large improvement over the CFSv1 from the ocean, land and atmosphere upgrades.
- The atmosphere upgrade in CFSv2 seems to be more important, especially to radiation and resulted T2m prediction. Both CFSv2 and Op3t3 CFS has low sensitivity to ocean boundary.
